

TASK 3: UX CASE STUDY

ZOMATO – FOOD DELIVERY APP

Case Study Report

Selected App: Zomato

Focus: User Journey, Strengths, Weaknesses and 3 UX Improvements

1. INTRODUCTION

Zomato is a popular food discovery and delivery platform. Users can search for restaurants and dishes, compare options, read ratings and reviews, place food orders, make payments and track deliveries. Since users usually want to complete food ordering quickly, a good user experience should make every step clear and easy.

This case study analyzes the Zomato user journey, identifies its major strengths and weaknesses, and proposes three practical UX improvements with simple sample mockups.

2. USER JOURNEY ANALYSIS

Step 1 – Open & Discover: The user opens Zomato and views restaurants, food categories, recommendations or search options.

Step 2 – Search: The user searches for a food item, cuisine or restaurant.

Step 3 – Compare: The user checks restaurant rating, price, delivery information, offers and reviews.

Step 4 – Browse Menu: The user opens a restaurant and selects dishes from the menu.

Step 5 – Cart: The user reviews selected items, quantity and total price.

Step 6 – Checkout & Payment: The user confirms the delivery address, checks charges and chooses a payment method.

Step 7 – Track Order: The user checks order status and delivery progress.

Step 8 – Receive & Review: After delivery, the user can rate the experience and may reorder later.

Overall journey: **Discover** → **Search** → **Compare** → **Select** → **Cart** → **Checkout** → **Track** → **Review**

3. STRENGTHS

- **Easy discovery:** Search and categories help users find food and restaurants quickly.
- **Rich information:** Ratings, reviews, menus and restaurant details support decision-making.
- **Convenient ordering:** The complete process from selection to payment is available in one app.
- **Order tracking:** Delivery progress helps users know the current status of an order.
- **Personalisation:** Recommendations and previous-order information can make repeat usage easier.

4. WEAKNESSES / PAIN POINTS

- **Too many choices:** A large number of restaurants and offers can make comparison difficult.
- **Information overload:** Users may have to process ratings, prices, delivery time, offers and reviews at the same time.
- **Checkout complexity:** Users may need to check several details before confirming an order.
- **Price clarity:** Users need a very clear final breakdown of food cost, taxes, delivery charges and discounts.
- **Availability changes:** An item becoming unavailable can interrupt the ordering flow.

5. THREE UX IMPROVEMENTS

Improvement 1 – Quick Restaurant Comparison

Add a simple comparison option that lets users compare two or three restaurants using rating, estimated delivery time, price range and key offers. This can reduce the effort needed to switch between restaurant pages.

SAMPLE MOCKUP 1 – Compare Restaurants	
■ Restaurant A ■ 4.5 30 min ■■	
■ Restaurant B ■ 4.3 25 min ■	
■ Restaurant C ■ 4.6 35 min ■■	
■ [Compare Selected]	

Improvement 2 – Clear Checkout Cost Summary

Show all costs in one clear section before payment. Users should immediately understand the item total, delivery fee, taxes, discount and final amount.

SAMPLE MOCKUP 2 – Checkout Summary	
■ Item total ■250	
■ Delivery fee ■30	
■ Taxes & other charges ■25	
■ Discount -■40	
■ -----	
■ FINAL TOTAL ■265	
■ [Confirm & Pay]	

Improvement 3 – Simpler Order Tracking

Use a clear step-by-step tracker with short labels and an estimated arrival time. This makes the order status easier to understand without requiring the user to interpret too much information.

SAMPLE MOCKUP 3 – Order Tracking	
■ ✓	Order Confirmed
■ ✓	Restaurant Preparing
■ ●	Delivery Partner Picked Up
■ ■	Arriving Soon
■	Estimated arrival: 8:20 PM

6. EXPECTED BENEFITS OF THE IMPROVEMENTS

- Faster restaurant selection and less comparison effort.
- Better understanding of the final amount before payment.
- Less uncertainty while waiting for delivery.
- Fewer mistakes during checkout.
- A simpler and more confident overall user experience.

7. CONCLUSION

Zomato provides a complete food-ordering journey with useful discovery, restaurant information, ordering and tracking features. However, the experience can be improved by reducing information overload, making cost details clearer and simplifying order tracking. The three proposed improvements—restaurant comparison, a clear checkout summary and a simpler order tracker—can make the app more efficient and user-friendly.
